The instrument types C01, C02, C11 and C12 listed in the table above are described in the VIBROCONTROL 1100 documentation.

Apart from the bearing condition, which is not applicable to the instrument types C11 and C12, the descriptions for all instruments are the same.
1 Overview

VIBROCONTROL 1100 is a 2 channel microprocessor controlled machine condition monitor. Vibration velocity transducers or vibration acceleration transducers (accelerometers) are used to sense the vibrations from a machine.

VIBROCONTROL 1100 is a compact machine monitor. All components, like power supply, connectors, signal conditioners, microprocessor and operator panel are integrated to one splash-proofed housing.

![Top view of a VIBROCONTROL 1100 with cover removed](image)

**Figure 1-1:** Top view of a VIBROCONTROL 1100 with cover removed

VIBROCONTROL 1100 is complete; there are no options. Three alarm relays, one OK-relay, two analog outputs, two buffered outputs, remote I/O interface, and signal conditioners are built-in.

There are no jumpers or potentiometers. All functions are completely microprocessor controlled and are configured using the built-in operator panel or via the remote interface with a computer or process controller.

The wiring is done through removable terminal strip connectors.

Vibration analyzers or data collectors can be connected to the buffered outputs without interrupting the monitoring functions.
Measured Values

Displayed Parameters

The measured values can be displayed in metric or English units:

<table>

</tbody>
</table>

If accelerometers are used, the Bearing Condition of rolling element bearings can be measured and monitored. The unit for Bearing Condition is BCU.

| Bearing Condition |  -  -  -  | BCU  |

BCU Scaling Factor

Due to the BCU scaling factor, the BCU measuring result can be multiplied with a factor. This factor is determined with parameter J19 for channel A and J20 for channel B in the range between 0.1 and 10. Factor 1 displays the measuring result not scaled.

The BCU scaling factor makes it possible to set the measuring result to a defined initial value in order to compare several measuring points. The BCU scaling factor is to be employed preferably with new bearings.

Note:

The selected scaling factor must be considered when setting the BCU limit value. If for instance the measuring result is divided by two due to the scaling factor, also the limit value must be divided by two.
Example how to use the BCU scaling factor

In case of BCU measurements, the measuring result depends on various factors, e.g. on the place of the pickup installation, on the type of connection (e.g. tightening torque of the pickup) etc. The consequence may be different measuring results with identical machines and the same bearing condition units. To enable a clear comparison of the single measuring points (change of the bearing condition over a longer measuring period), by means of the BCU scaling factor (parameters $J19$, $J20$) the measuring results can be set to the same initial value (desired value at the beginning of the measurement) for each measuring point.

Carry out scaling

Input the scaling factor 1 for the respective measuring points. Acquire the current measuring result. From the desired BCU initial value and the current measuring result of the respective measuring point, the BCU scaling factor $J19$ or $J20$ is calculated with the following formula:

$$J19 = \frac{\text{desired initial value}}{\text{current measuring result}}$$

After the parameter input of all scaling factors, the respective measuring point must display the desired BCU initial value.
BCU averaging

The BCU value may vary depending on the operating conditions of a machine, for example due to varying loading conditions. A defective anti-friction element which regularly changes its position in such a way that the damaged part comes into contact with the bearing running surface only after several revolutions, will also cause varying BCU values. Variations of that kind do not allow the conclusion that the bearing is damaged.

The measured value can be averaged by means of a filter with settable time constant (averaging time 10 ... 3600 secs.) in order that these "variations" (which do not represent the normal condition of the machine) don't cause an alarm message.

The bigger the selected averaging time
- the more stable the measured value (particularly important for trend considerations)
- the more delayed the response behaviour of the limit value monitoring.

The averaging be switched on and off separately for channel A and channel B (parameters J15 ... J18).
Measuring Ranges

The measuring ranges are microprocessor controlled and can be selected continuously within the limits defined in the following table:

Transducer: Vibration acceleration pick-up
Signal detection: Root mean square value

<table>
<thead>
<tr>
<th>Measured Parameter</th>
<th>Measuring Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>

<td>0 ... 333</td>
</tr>
<tr>
<td></td>
<td>0 ... 2.00</td>
<td>0 ... 13.3</td>
</tr>
</tbody>
</table>

Multiply values by 1.41 for peak-values and by 2.82 for peak-to-peak values. The largest acceptable number is 999.

The measuring ranges for BCU-Monitoring are independent of the measuring ranges for vibration monitoring.

<table>

Transducer :  
\( v = \) Vibration Velocity Transducer  
\( a = \) Accelerometer

*) Fulfills the requirements of International Standard ISO 2372

Signal Conditioning and Signal Detection Type

The built-in signal conditioners are microprocessor controlled. Gain factors, filters, and the integrator are set automatically. The settings are determined by the microprocessor from the configuration.
Linearization

The characteristic of vibration velocity transducers is not linear in the lower frequency range, i.e. with frequencies around 10 Hz. VIBROCONTROL 1100 corrects this nonlinearity with a built-in linearization circuit (Standard $f_o = 8$ Hz / the special design $f_o = 15$ Hz is identified by an adhesive label inside the instruments). The result is a linear frequency response characteristic for the total measuring system down to 1 Hz. The linearization circuit can be activated or deactivated by means of parameter input (IO6).

Settling Time and Cycle Times

Electronic components like amplifiers, filters, etc. need a certain amount of time to provide the correct output signal after the input signal has been switched or changed. This time is called settling time. Components used to measure low frequencies have longer settling times than components used to measure higher frequencies.

VIBROCONTROL 1100

can be configured as a single channel monitor or a 2 channel monitor.

Single Channel Monitor (Vibration and Bearing Condition)

Operating as a single channel monitor, settling times are not required, since the vibration signal is not switched from channel A to channel B. The configuration, filter characteristic and gain, etc. of the Vibration Signal Conditioner and the Bearing Condition Detector do not need to be changed; therefore the vibration signal is measured continuously.

Cycle Time: Built-in Display 0.5 s
Alarm level comparison 0.25 s

2 Channel Monitor (Vibration)

The vibration signals of channel A and B are switched alternately (multiplexed) to the Vibration Signal Conditioner. For each switch between channel A and B, the Vibration Signal Conditioner is automatically re-configured and settling times are required. The total time for one measurement consists of the settling time and the measurement time. The measurement time is always 3 seconds. Outside the measuring times, the current display values of the other channel are frozen, the current measured value, however, is monitored in intervals of 0.25 seconds.
The following table shows the settling times and the cycle times (sum of settling and measuring time) for different functions and setups of the Vibration Signal Conditioner. Different setups can be used for channel A and B. The total cycle time is the sum of the cycle times for channel A and B.

<table>
<thead>
<tr>
<th>Activated Function</th>
<th>Settling Time</th>
<th>Cycle Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>High Pass Filter: 1 Hz</td>
<td>1.75 s</td>
<td>4.75 s</td>
</tr>
<tr>
<td>High Pass Filter: 3 Hz</td>
<td>1.00 s</td>
<td>4.00 s</td>
</tr>
<tr>
<td>High Pass Filter: 10 Hz ISO</td>
<td>1.25 s</td>
<td>4.25 s</td>
</tr>
<tr>
<td>High Pass Filter: Special</td>
<td>1.75 s</td>
<td>4.25 s</td>

<tr>
<td>Integrator</td>
<td>6.00 s</td>
<td>9.00 s</td>
</tr>
<tr>
<td>Linearization Circuit:</td>
<td>5.75 s</td>
<td>8.75 s</td>
</tr>
</tbody>
</table>

If more than one function has been selected, the function with the longest settling time determines the total settling time.

2 Channel Monitor (Vibration and Bearing Condition)

Since VIBROCONTROL 1100 is equipped with a Bearing Condition Detector, the measurement of Bearing Condition is independent of the vibration measurement. The settling time is 2.75 s and the measuring time is 1.25 s.
Monitoring

Each measuring channel has three limit values. Two limit values for monitoring the vibration level, (lim_1 and lim_2), and one limit value for Bearing Condition (lim_b). Each limit value can be set individually.

Each limit value can be set to any value between 10 % and 100 % of the measuring range. Larger or smaller limit values are not accepted and will generate an error message.

For each limit value an alarm delay time between 1 and 99 seconds can be selected. Limit value exceedance is only acknowledged if the monitored signal remains above the limit value for a period of time longer than the selected delay time. When acknowledged, the event is entered into the ‘Log Book’, and if it is configured to do so, the appropriate relay trips.

In the 2 channel mode the alarm delay time is related to the measurement cycle of the appropriate channel. Two cases have to be considered:

Case 1

The measured value exceeds the limit value and the alarm delay time is shorter than the remaining measurement time of this cycle. If the measured value stays above the limit value, the alarm event is acknowledged after the alarm delay time.

Case 2

The measured value exceeds the limit value and the alarm delay time is longer than the remaining measurement time of this cycle. At the end of the measurement cycle, the alarm delay time is suspended. If the measured value still exceeds the limit value at the beginning of the next measurement cycle, the alarm delay time is resumed. This procedure is continued until the end of the alarm delay time. At this point the alarm event is acknowledged. In case 2 the alarm delay time is prolonged by the measurement cycle of the other channel.
Log Book

All events are stored in a circular buffer using short notation. This buffer can store up to 99 events.
Events are:
Power Up; limit value exceedance; reset instructions; and internal errors detected by the self monitoring.

If the Log Book capacity is exceeded, the "oldest" event is deleted and all stored events are shifted one position, freeing space to store the new event.
The Log Book can be displayed on the built-in display or read via the remote interface.
Each Log Book entry begins with an "H", (for History) followed by a two digit running number and a 'short' notation of the event.

Example:

H03 K1 Lim1 A

Meaning:

<table>
<thead>
<tr>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>H03</td>
<td>Label of Log Book entry</td>
</tr>
<tr>
<td>K1</td>
<td>Relay K1 tripped</td>
</tr>
<tr>
<td>Lim1</td>
<td>because limit value lim_1 of channel A has been exceeded.</td>
</tr>
</tbody>
</table>

The Log Book is deleted every time the VIBROCONTROL 1100 is powered up. It can also be deleted using the built-in operator panel or via the serial interface.
Relays
Three relays are provided which are activated on alarm exceedance if so programmed. They are designated as K1, K2, and K3.

Programming the Relays
Relay operation is defined by the setup parameters:

1. Which limit value controls which relay.
2. Latching or Non-Latching Mode.
3. Energized or de-energized Operation.
4. Control a relay by combining several limit values using a logical OR or AND statement.

Comment to 1.
Limit value exceedances can be configured as single events or grouped events. A configuration that is commonly used is, lim_1A and lim_1B control relay K1, and lim_2A and lim_2B control relay K2.

Comment to 2.

*Latch Mode*

The relay remains latched (triped) until it is reset using the control panel, reset switch, or via the remote interface.

*Non-Latching Mode*

The relay is automatically reset when the measured value drops below the limit value.

Comment to 3.
This choice depends on the user’s philosophy. What is important though, is preventing a false relay trip if power to the VIBROCONTROL 1100 is disconnected.

<table>
<thead>
<tr>
<th>Mode</th>
<th>No Alarm</th>
<th>Alarm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normally Energized</td>
<td>Relay active</td>
<td>Relay not active</td>
</tr>
<tr>
<td>Normally De-Energized</td>
<td>Relay not active</td>
<td>Relay active</td>
</tr>
</tbody>
</table>
Comment to 4.

**AND**
Several limit values control one relay. This relay is tripped only if all limit values are exceeded.

**OR**
Several limit values control one relay. This relay is tripped if at least one limit value is exceeded.

Note:
If a measuring channel or a limit value has been set to "not active" ("N") and this limit value is combined with an AND, this logical condition can never become "true". Therefore the alarm indication can never be activated.

**OK-Monitoring**

The OK-Monitoring is used to report malfunctions and/or data failure of the program and data stores, electric damages or the failure of the pickup and its connection lines. The monitoring covers an "External range recording" of the vibration signal. Errors caused by cable breakage, short circuit or earth fault of the signal lines are recognized, reported and written into the log book.

Since the OK-Relay is normally energized, the messages are output in the operating state network ON/OFF.
System messages such as:

- no calibration data in EEPROM
- no dialog data in EEPROM

will cause an OK-error which can be reset by means of Relay Reset.

Important:

When an OK error occurs, all limit relays maintain their current status. After removing the OK error and acknowledging it by “Relay Reset”, they perform their normal function again.

In case of a system error message, e.g.

- calibration data not readable (ER -31)
- no valid calibration data in the EEPROM (ER -37)

a hardware error is present.

This error can only be eliminated by a Schenck service station or in the parent company.
Inputs and Outputs

Inputs

VIBROCONTROL 1100 accepts vibration velocity transducers or accelerometers. In 2 channel operation, pickups of the same type with the same sensitivity are required. Accelerometers (passive transducers) are powered by the internal power supply of VIBROCONTROL 1100.

Outputs

a) Alarm Indication

Alarm level exceedances are indicated by galvanically free relay contacts.

b) Analog-Outputs

Two separate analog outputs are provided for analog meters or strip chart recorders. Which measured parameter is supplied on which analog output is determined during the setup. Each analog output can be configured for either 0 ... 10 V or 0.4 ... 20 mA.

Remote I/O (Serial Interface)

Up to 205 VIBROCONTROL 1100 can be daisy-chained to one serial interface of a computer or process controller. Status, Log Book, and measured values can be read, stored, displayed, printed, etc. In addition the configuration of each VIBROCONTROL 1100 can be confirmed and modified.
Definitions

Several terms are commonly used for measured vibration parameters. The following is a summary of terms used in this manual.

Signal Detection Type:
Zero-to-Peak Value *)
Definition: The maximum deviation of the absolute value of the vibration signal from zero.
Used here: peak or pc
Other terms: peak-value, amplitude, single amplitude

Signal Detection Type:
Peak-to-Peak Value *)
Definition: The maximum distance between peak negative and peak positive of the vibration signal.
Used here: peak-to-peak or ppc
Other terms: amplitude, double amplitude

Signal Detection Type:
Root-Mean-Square Value
Definition: The square root of sum of the squared amplitudes over a period of time. Describes the energy content of a vibration signal.
Used here: rms
Other terms: effective value, true rms value

*) VIBROCONTROL 1100 measures the true rms value. Peak values are calculated from the rms value using the formulae:

Beispiel:
zero-to-peak value = rms value x 1.41 [pc]
peak-to-peak value = rms value x 2.82 [ppc]
This page has been reserved for your notes.
2 Technical Data

Supply Voltage

- Type VC-1100-C01
  Type VC-1100-C11
  115 V AC or
  230 V AC +15 % / -25 %
  jumper selectable
  48 ... 400 Hz
  approx. 15 VA

- Type VC-1100-C02
  Type VC-1100-C12
  24 V DC (16 ... 36 V)
  approx. 15 W

Power consumption

Fuses

- Supply Voltage 115/230 V AC
  2 Thermo-Resistors
  250 °F (125 °C)
  built-in the primary
  transformer windings

- Supply Voltage 24 V DC
  Transducer supply -24 V
  NTC - Resistor
  2 x 30 mA short-circuit-proof

- EMC Emitted interference
  according to EN 50081-1

- Immunity from interferences
  according to EN 50082-2
Housing and Operating Conditions

Housing

- Material: Aluminium AL Si 12
- Seal type: IP 65 (DIN 40050) splash proof (water)
- Dimensions: 360 x 160 x 91 mm (LxWxH) 14.2 x 6.3 x 3.6 inch (LxWxH)
- Weight: app. 5 kg (11 lbs)
- Cable fittings: 9 x PG 9 and 3 x PG 13.5 feed-throughs adapters PG 9 to 1/2-14 NPT are available
- Paint: RAL 7032 (grey) Top cover RAL 2011 (orange)

Operating Conditions

- Storage Temperature Range: -20 ... + 70 °C (4 ... 148 °F)
- Operating Temperature Range: 0 ... + 50 °C (32 ... 122 °F)
- Rel. Humidity: max. 95 % non condensing
Analog Circuits

Channels 2
Inputs 1) 2) accept
   a) Vibration Velocity Transducers with a sensitivity of 100 mV/mm/s, \( f_0 = 8 \text{ Hz} \), \( R_i = 4 \text{ k}\Omega \)
   b) Accelerometer with a sensitivity of 100 mV/g (10.2 mV/m/s^2)

Input Impedance approx. 100 k\Omega

Accuracy

(for frequency ranges listed below:)

- Vibration Parameters
  \( \pm 0.5 \% \) of full-scale plus:
  \( \pm 4.0 \% \) of the meas. value (1 Hz...3 Hz)
  \( \pm 2.0 \% \) of the meas. value (3 Hz...10 Hz)
  \( \pm 1.0 \% \) of the meas. value (10 Hz...100 Hz)
  \( \pm 2.0 \% \) of the meas. value (1000 Hz...10000 Hz)

- Bearing Condition
  \( \pm 6 \% \) of the measured value plus or
  \( \pm 3.5 \% \) of full-scale, whichever is greater

Frequency Range 3)

The 10 Hz high-pass and 1000 Hz low-pass filters are of the 3.rd order, and meet the requirements of DIN/ISO 2373, DIN/ISO 3945 and DIN 45 666. All other filters are 2nd order Butterworth filters, with -1 dB damping at specified corner frequencies.

- Vibration Displacement: 10...1000 Hz (v- pickup)

1) VIBROCONTROL 1100 accepts 2 pickups of the same type and sensitivity.
2) The setup is microprocessor controlled via the built-in operator panel or Remote Interface.
3) The respective selection is made software-controlled in dialog mode.
• Vibration Velocity:  
  1... 1000 Hz (v-or a-pickup)  
  or 3... 1000 Hz (v-or a-pickup)  
  or 10... 1000 Hz (v-or a-pickup)  
  or 10...10000 Hz (a-pickup)

• Vibration Acceleration:  
  3... 1000 Hz (a-pickup)  
  or 10... 1000 Hz (a-pickup)  
  or 3...10000 Hz (a-pickup)  
  or 10...10000 Hz (a-pickup)

• Bearing Condition:  
  13 kHz ... 64 kHz- 3 dB (a-pickup)

Measured Parameters and Signal Detection Type 3)

• Root-Mean-Square-Value $X_{rm}$ or $X_{eff}$ for s/v/a

• Zero-to-Peak-Value $X_{pc}$ for s/v/a

• Peak-to-Peak-Value $X_{ppc}$ for s/v/a

• Bearing Condition BCU

3) The respective selection is made software-controlled in dialog mode.
4) Ranges between min. and max. are infinitely variable.
Measuring Ranges

The measuring range depends on the selected pickup type, measured parameter, and signal detection type. The range is continuously adjustable within the minimum and maximum values shown in the table.

- Total number: 6 (3 per channel)
- per channel:
  - 1 limit value 1 (lim_1)
  - 1 limit value 2 (lim_2)
  - 1 limit value Bearing Condition (lim_b)

Relays

- Self-Monitoring: 1 OK-Relay to indicate malfunctions detected by the self-monitoring function
- Alarm Level Exceedances: 3 Relays K1, K2, K3 to indicate alarm level exceedances
- Range of settings for limit values: 10 ... 100 % of the corresponding measuring range
- Contacts: 2 pole
- Contact Rating:
  - 250 V AC, 5 A (Ohm Load, \( \cos \varphi = 1 \))
  - 250 V AC, 2 A (Inductive Load, \( \cos \varphi = 0.4 \ldots 0.7 \))
  - 24 V DC / 0.4 A
  - 48 V DC / 0.2 A

⚠️ A spark extinguisher must be installed as close to the spark generator as possible!

3) The respective selection is made software-controlled in dialog mode.
♦ Link of limit values to relays

• Each limit value can be linked only once
• None or 1 to 6 limit values can be linked to one relay
• If a relay is linked to several limit values, the limit value exceedances can be combined in two ways:
  a) AND
  The relay trips, if all limit values that are linked to this relay are exceeded.
  b) OR
  The relay trips, if at least one of the limit values linked to this relay is exceeded.

• OK-Relay normally energized
• Alarm relays 3) normally energized
  K1, K2, K3 or normally de-energized latching or non-latching
• Alarm delay Time 3) can be set individually for each limit value from between 1 and 99 s (accuracy ± 5 %
• Reset function 1 galvanically free contact switch to reset latched relays.

♦ Remote Interface

Number of Ports 2 Interface Type RS-232-C (EIA), (Data only)
• Baud rate 3) 1200, 2400, 4800 or 9600 Parity none Data Bits 8 Stop Bits 1

3) The respective selection is made software-controlled in dialog mode.
3 Connectors and Interfaces

Fundamentals

♦ All connections including those for power are inside the housing.

♦ Feed cables into the housing via feed-through fittings. There is a total of 3 x PG 13.5 and 9 x PG 9 feed-through fittings; 6 on each side. The threads are PG9, a standard commonly used in Europe. Each VIBROCONTROL 1100 comes with two PG9/PG7 adapters. PG9/1/2"-NPT adapters are also available. Maximum cable size is 1.5 mm² (16 AWG). Use flexible cable only.

♦ Cable ends should have crimp ferrules for a proper connection to the removable terminal strips. Remove (unplug) the terminal strips during wiring. VIBROCONTROL 1100 groups the terminal strips in functional blocks (pickups, remote I/O, relays, etc.) and each is coded to prevent mix-ups.

Use shielded cables to suppress external RF noise. This is not necessary for power and relay wiring. Connect all shields to the screw terminals located on top of both sides of the internal housing (SE).

♦ Run signal cables a minimum of 0.5 m (20 inches) from power cables. If you must cross a power cable do so at right angles.

By means of steel flexible tubes, protect signal leads from mechanical damage and electrical interferences.

Symbols

Folgende Abkürzungen werden verwendet:

- **TE** = Technical Earth (Ground)
- **SE** = Shield Earth (Ground)
- **PE** = Protective Earth (Ground)
- **↓** = General Symbol for Reference Level
- **0VA** = Analog Circuits
- **0VD** = Digital Circuits
- **L** = Line Voltage
- **N** = Neutral
- **DC** = Direct Current/Voltage
- **AC** = Alternating Current/Voltage
- **TD** = Transmit Data (RS-232-C)
- **RD** = Receive Data (RS-232-C)
- **SG** = Signal Ground (RS-232-C)
- **BA** = Buffered Output Channel A
- **BB** = Buffered Output Channel B

TE (0VA) and 0VD can be connected at a central point.
Important: Safety Procedures

The safety instructions are attached as a separate brochure in different languages.

The user is responsible for commissioning the VIBROCONTROL 1100 and its placement in the operating environment. Special care should be taken when installing pickups in hazardous areas. Apply safety standards properly.

24 V DC Wiring

- Coded Terminal strip 19 - 24 cannot be plugged into any other slot but its own.

Grounding

Connect protective ground of the power cord to the PE terminal located on top of the internal housing. This is the central grounding point for the housing. This point (PE) is connected to TE by a jumper wire between terminal strip 1/2 and SE. This is the standard configuration.

In special cases, for example if a peripheral instrument is used with internally grounded inputs, open the connection between PE and TE by removing this jumper wire.

Please consult the General Grounding Recommendation in this manual.
Pickups

Two types of pickups can be connected:

a) Vibration Velocity Transducers  
b) Vibration Acceleration Transducers (Accelerometers)

Velocity pickups and accelerometers have different interfaces. The velocity transducer (Type VS - ...) is an active pickup, i.e. it does not require a supply voltage. The cable has two conductors and a shield.

The accelerometer (Type AS - ...) is a passive pickup, i.e. it has a built-in charge amplifier which requires a supply voltage. VIBRO-CONTROL 1100 supplies accelerometers with -24 V DC with a max. current of 30 mA. The cable has of 4 conductors and a shield.

Fig. 3 - 3 : Connecting Vibration Velocity and Vibration Acceleration Transducer

rt = red, ws = white, sw = black, ge = yellow, br = brown,  
ge/sw = yellow/black

Standard pickup cable length is 5 m (16 feet). A maximum cable length of 200 m (600 feet) requires proper installation including appropriate junction boxes and signal cables.  
For more information, please consult the manual for the pickup used.
Relay Reset

Use only galvanically free switches with the Relay-Reset Input to manually reset latched relays. Latched relays can also be reset via the operating panel or through the remote interface.

Fig. 3 - 4: Connection of a galvanically free switch to the Relay Reset-Input
Outputs

Relays
Consider the following if the relay outputs are to be used.

♦ Decide if the relays are to be "normally energized" or "normally de-energized". Setup parameters (N10, N11, N12) must be consistent with the wiring. Refer to the examples on the next page.

♦ If a relay is configured as latching (see parameters N07, N08, N09) there are three ways to reset it. With the operating panel; via the remote interface; using the Relay-Reset Input. To use the Relay-Reset Input, connect a galvanically free switch to terminals 35 and 36 (see previous page).

♦ If conductive loads are connected, provide appropriate spark suppression placed as close as possible to the part that would generate the spark.

Contact Rating: max. 5 A, 220 V AC (Ohmic load)

*A spark extinguisher must be installed as close to the spark generator as possible!*

Figure 3 - 5 shows the contacts in the de-energized position.
Relays

The following diagrams explain the terms
- normally de-energized and
- normally energized

The thicker lines show energized circuits.

**Normally de-energized**

**Fig. 3 - 6: Explanation of the Normally De-Energized and Normally Energized Mode for Relays**
Analog Outputs

The analog outputs are used for example with strip chart recorders and analog meters. These analog outputs are not galvanically free, (isolated) and should only be used with instruments that have galvanically free inputs.

Both analog outputs are independent and of equal design.

Their function depends on how they are configured (see parameters L1, L2, L3, L4).

Example:

Configure analog output 1 for the measured vibration value of channel B "vib_B" using a 4 ... 20 mA signal.

The setup parameters for channel B are:

- Measured Parameter J04: v (vibration velocity)
- Unit J06: mm/s (or ips)s
- Signal Detection J08: rms
- Measured Tange J10: 50.0 (or 2.00)

Using this setup, an output signal of 4 mA corresponds to a vibration level of 0 mm/s (0 ips). An output signal of 20 mA corresponds to a vibration level of 50.0 mm/s (2.00 ips).

Technical Data:

Current Output: 0/4 ... 20 mA Load < 500 Ω
Voltage Output: 0 ... 10 V \(R_L\) > 1 kΩ, short-circuit proof

Fig. 3 - 7: Connecting Analog Outputs
Buffered Outputs

The buffered outputs provide the pickup signals for on site analysis or data collection. The signal is attenuated by a factor of 0.1. The buffer amplifier strips off the DC part of the pickup signal.

Max. output current $I_{\text{max}}$ : 4 mA
Ohmic load $R_L$ : $> 10 \, k\Omega$
Max. cable length with cable capacity of 70 pF/m (Wire against wire) : $\leq 16 \, m$

![Diagram of VC 1100 Connectors and Interfaces](image)

Fig. 3 - 8: Connecting to the Buffered Outputs for On Site Analysis
Remote I/O

VIBROCONTROL 1100 has two RS-232C serial interfaces. Hardware handshakes are not required for communication with process controllers or personal computers (HOST). This reduces the number of cable conductors required.

Cables should be shielded with two twisted pairs. The Remote Interface provides a means to interrogate and modify the configuration as well as obtain the measured values from up to 205 daisy-chained VIBROCONTROL 1100's.

VIBROCONTROL 1100 can be connected to a HOST in two different ways:

a) A HOST communicating with one VC-1100
   for 25-pole Sub-D Plug

   Fig. 3 - 9: Interfacing a HOST with one VC-1100

b) A HOST communicating with one VC-1100
   for 9-pole Sub-D Plug

   RD = Receive Data (receive)

   TD = Transmit Data (send)

   SG = Signal Ground (Ground)

   Fig. 3 - 10: Interfacing a HOST with one VC 1100
c) **A HOST Communicating with Several VIBROCONTROL 1100**

The HOST can control up to 205 daisy-chained VIBROCONTROL 1100's with one serial interface on the HOST. Each VIBROCONTROL 1100 has a unique address. If a VIBROCONTROL 1100 does not receive its unique address, it passes the message to the next unit. If one unit is removed, the daisy-chain must be closed as shown in figure 10.

For more information, please consult the "Remote I/O" chapter in this manual.

**Fig. 3 - 11:** Interfacing a HOST with several VC-1100's

Use commercially available shielded data transfer cables with two twisted pairs.

Display

A 16 digit alphanumeric LCD display provides access to the Measured Values, Relay Status, Log Book, and Setup Parameters.

During normal operation the display is dark. The display shown in the above figure appears after pressing any key. This display - the main menu - informs the user about the monitor unit, model and version.

Starting from the main menu, you can access the different function modes by pressing appropriate keys.

The microprocessor returns to the main menu automatically if a key is not pressed for 15 minutes, and the display will be turned off after an additional 15 minutes of inactivity.
Display Setup Parameters

Starting point

During normal operation the display is dark. The main menu will appear if any key is pressed.

Press any key.
The main menu appears.

Pressing this key at this time has no effect, since I01 is the first parameter.

Step to the next parameter number.
Reach any parameter by pressing either the up or down arrow key.
Press and release the key to go to the next parameter (single step). Press and hold the key if you want to scroll through the parameter numbers faster. The longer you hold a key down, the faster the parameter numbers change. The last parameter is P02.

Exit "Display Setup Parameters" mode and return to the main menu.
Change Setup Parameters

Access all modes from the main menu. Exit a mode and return to the main menu by pressing ESC. If the display is dark, press any key to turn it on.

ESC or P

The main menu appears.

Hold the ESC key DOWN, then press P key. A cursor that underlines the parameter group indicates that the parameter group and number can be changed. Step to the next parameter number using the and keys.

Pressing this key at this time has no effect, since l01 is the first parameter.

Step to the next parameter number. Reach any parameter by pressing either the up or down arrow keys. Press and release the key to go to the next parameter (single step). Press and hold the key if you want to scroll through the parameter numbers faster. The longer you hold a key down, the faster the parameter numbers change. The last parameter is P02.

Access the change parameter value mode by pressing P.
A flashing parameter group indicates change of the parameter value is allowed.

Change the parameter value using the and keys.

To save the shown parameter value press again. The parameter group no longer flashes. The new parameter value is in effect upon exiting to the main menu.

Step to the next parameter number.

or

Exit "Change Setup Parameters" and return to the main menu. The microprocessor will automatically start a consistency check for the new parameter list. This check will generate an error message if the parameters are not consistent.

Example:
The following parameters

I03 Vibration velocity transducer

J05 Unit of the measured parameter g

Error messages see explanations on page 16.
Confirm the error messages by pressing any key. The program will automatically show the inconsistent parameter.

Correct the error:
Press \( \text{F1} \)
Adjust parameter value: \( \text{F2} \)
Accept parameter value by pressing \( \text{F1} \)
Exit to main menu \( \text{F3} \)

If the setup is consistent, the program returns to the main menu. If not, the display shows the next error message. Correct this error and repeat the procedure until the setup is consistent. Find explanations of error messages on pages 15 of this chapter.

Escape from the change parameter value mode by pressing \( \text{F3} \).

Press \( \text{F3} \) to return to the select parameter number mode.

Press \( \text{F3} \) again to return to the main menu.
Quick Reference to the Change Setup Parameters Mode

The start is always made from the main menu.
Enter the "Change Setup Parameters" mode.

Select the parameter you want to change.

Access the change parameter value mode.

Change the parameter value.

Save the new parameter value.
Change other parameters or press to return to the main menu.
If the new setup is consistent, it is accepted and it becomes the current setup and the main menu appears.

If not, an error message will appear (see previous page).
The consistency check takes about 15 s. During this time the monitoring function is suspended.
Display Measured Values

Access all modes from the main menu. Exit a mode and return to the main menu by pressing ESC. If the display is dark, press any key to turn it on.

Main menu appears.

The display shows vibration level of channel A. A flashing display indicates a limit value was exceeded.

Step to next measured values:
- Bearing condition channel A
- Vibration level channel B
- Bearing condition channel B

Relay status

 Relay identification
 Event
Step to next entry using \( \text{key} \), or press ...

Press \( \text{key} \) to enter the change status mode

Select:
Y: Reset relays
N: Do not reset relays.

Accept reset command and return to display mode.

Press \( \text{key} \), and show Log Book.

Step to first Log Book entry.
The Log Book stores up to 99 events. After the last Log Book entry, you can delete the Log Book.

Delete Log Book: Press \[ \text{to allow change}\]
Select Y using \[ \text{Press \[ to delete the Log Book.}\]

The Log Book is deleted

Exit the Display measured values mode and return to the main menu.

Find an explanation of the Log Book entries and events on pages 14 and 15 of this chapter.
Service Mode

Access all modes from the main menu. Exit a mode and return to
the main menu by pressing \textit{ESC}.

If the display is dark, press any key to turn it on.

\textbf{Main menu appears.}

\textit{Before accessing the service mode},

consider that

\begin{itemize}
  \item[a)] the service mode suspends the measuring and monitoring
  modes.
  \item[b)] activating the relays could cause machine shut-down.
\end{itemize}

\begin{itemize}
  \item[\textbf{Hold down the}] the \textbf{key}, and press the \textbf{key} to enter the service
  mode. The service functions all start with an \textbf{S}.
\end{itemize}
Check Relays

The service mode provides direct access to relay activation.

Change the relay status by pressing \( \text{Sel} \) and \( \text{Ent} \).
Used to check operation of devices connected to the relays.

K1 off: Relay not active.
K1 on: Relay active

Press \( \text{Ent} \) to exit test of relay K1.
Step to next function by pressing \( \text{Sel} \).
Check relays K2 and K3:

Function S04 checks the OK-Relay.

OK off : OK-Relay not active.
OK on : OK-Relay active.

Press \( \text{Sel} \) to exit the OK-Relay test.
Test analog output 1.
Select voltages of 0, 2, 5, or 10 Volt by pressing \text{\textcircled{1}} \text{\textcircled{1}}.

Press \text{\textcircled{2}} to exit. Press \text{\textcircled{1}} to go to next test.

Test analog output 1.
Select currents of 0, 4, 12, or 20 mA by pressing \text{\textcircled{1}} \text{\textcircled{1}}.

Analog output 2 is tested in the same manner.

<table>
<thead>
<tr>
<th>Analog Output 2</th>
<th>Voltage</th>
</tr>
</thead>
<tbody>
<tr>
<td>\text{\textcircled{3}}</td>
<td>0 V</td>
</tr>
<tr>
<td></td>
<td>2 V</td>
</tr>
<tr>
<td></td>
<td>5 V</td>
</tr>
<tr>
<td></td>
<td>10 V</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Analog Output 2</th>
<th>Current</th>
</tr>
</thead>
<tbody>
<tr>
<td>\text{\textcircled{4}}</td>
<td>0 mA</td>
</tr>
<tr>
<td></td>
<td>4 mA</td>
</tr>
<tr>
<td></td>
<td>12 mA</td>
</tr>
<tr>
<td></td>
<td>20 mA</td>
</tr>
</tbody>
</table>

Press \text{\textcircled{5}} to start the self-test. During the self-test, a count down from 10 to 0 is displayed. OK will appear on the display if the test is completed successfully.

The self-test does not suspend the monitoring mode.
VIBROCONTROL 1100 has the ability to perform a self-calibration. This function requires about 20 minutes. During the self-calibration the monitoring mode is suspended, a count down is and displayed from ??? to 0, at which time the display returns to:

Press ☿ to exit self-calibration and return to the main menu.
Events

The microprocessor stores events in the Log Book using a short notation. The Log Book can store up to 99 events. When the 100th event occurs, the "oldest event" is dropped making room for the new 100th event. The Log Book events are maintained until an instruction is received to erase all entries.

All Log Book entries start with a "H" (for History) followed by a two digit running number and a short description of the event. If a relay trips, the Log Book entry identifies the relay and the cause of the relay trip.

Example:

<table>
<thead>
<tr>
<th>Event</th>
<th>Cause</th>
</tr>
</thead>
<tbody>
<tr>
<td>H01 OK POWER OFF</td>
<td>OK-Relay is active for 15 seconds after power is returned.</td>
</tr>
<tr>
<td>OK A</td>
<td>OK-Relay is active. Malfunction Channel A</td>
</tr>
<tr>
<td>OK B</td>
<td>OK-Relay is active. Malfunction Channel B</td>
</tr>
</tbody>
</table>

If the event is a logical AND combination of events, the combination is displayed. In this case, the plus sign replaces the AND.

A trip of the OK-Relay generates one of the following Log Book entries:
A trip of relays K1, K2, or K3 generates the following Log Book entries:

<table>
<thead>
<tr>
<th>Event</th>
<th>Cause</th>
</tr>
</thead>
</table>
| K1 Cause | Relay K1 is active.  
See list of causes below. |
| K2 Cause | Relay K2 is active.  
See list of causes below. |

</tr>
<tr>
<td>RESET EXTERN</td>
<td>Relay reset via reset input</td>
</tr>
<tr>
<td>RESET RS-232</td>
<td>Relay reset via Remote-I/O</td>
</tr>
</tbody>
</table>
Error Messages

VIBROCONTROL 1100 automatically checks for setup consistency upon exiting the "Change Setup Parameters" mode. If the setup is not consistent, an error message is displayed.

The consistency check stops at the first inconsistency detected. It assumes that the parameter with the lowest number is correct. Therefore, a parameter other than the one displayed could be the cause of the inconsistency.

A list of error messages appears on the next page.
Unit errors

Format: \( \text{ER} -nn \) is a number with 1 to 5 digits

Example: \( < \text{ER} -1< \)

</tbody>
</table>
How to react to error-messages?

The 2nd column of the above list of error-messages contains the characters „k“ „r“ „l“ „2e“ and „w“. These characters show what to do if the corresponding error message occurs.

- **k**: Repeat the command.
  - If VIBROCONTROL 1100 repeats this error-message after several retries, there is a severe problem and the instrument must be sent to SCHENCK for repair.

- **r**: Send VIBROCONTROL 1100 to SCHENCK for repair.
  - This error activates the OK-relay temporarily, because an automatic restart is performed.

- **!**: Sporadic occurrence of this error indicates that external noise effects the unit. Check installation, especially shielding of cables and grounds.
  - Permanent occurrence of this error indicates a severe fault. Send unit to SCHENCK for repair.

- **e**: Re-do configuration or download consistent setup. If this is not successful, send unit to SCHENCK for repair.

- **w**: Repeat command using correct data.
5 List of Setup Parameters

Basic Concepts

VIBROCONTROL 1100 stores its setup parameters in non-volatile memory. The operating system uses this data to configure the analog circuits and the software modules. All data is uniquely named. We call this data "Setup Parameters" or simply "Parameters" and reference them by name. The setup parameter values can easily be changed within predefined ranges, providing a convenient way to configure the measuring and monitoring system.

VIBROCONTROL 1100 checks the consistency of the setup after leaving the "Change Setup Parameters" mode. If the setup is inconsistent, the display shows an error message. The setup must be corrected since the VIBROCONTROL 1100 will not accept an inconsistent setup.

Parameter list structure

Parameters are listed in sequence with a complete definition. The definition describes its function, choices, and range.

The same format is used for all parameters.

Example:

<table>
<thead>
<tr>
<th>Group</th>
<th>Number</th>
<th>Title</th>
<th>Choices</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>K 01</td>
<td></td>
<td></td>
<td>1 Hz, 3 Hz, 10 Hz ISO</td>
<td>Select the lower frequency corner for channel A</td>
</tr>
</tbody>
</table>

Parameter specifier

All setup parameters are organized in functional groups. The "Parameter Specifier" consists of a group and a number within the group. The first character specifies the group and the two digit number specifies the individual parameter.
Parameter Title

The "Parameter Title" is a short description of the parameter's function.

Parameter Groups

Group I  Channel and Pickup Selection
Define measuring channels
Pickup type and sensitivity

Group J  Channel Configuration
Define measured parameters, units, signal detection type, and full scale.

Group K  Filter Configuration
Define upper and lower frequency corners.

Group L  Analog Outputs
Assign measured parameters and define signal type.

Group M  Limit Configuration
Define monitoring functions, limit values and delay times.

Group N  Relay Configuration
Assign limit values to relays. Define relay operation.

Group O  OK Monitoring
Enable/Disable

Group P  Serial Interface
Define device address and baud rate.

Group S  Service Functions
Check relay operation.
Set analog outputs to predefined levels.
Run self-test and Self-calibration.
Additional Information

A functional description of the setup parameters for a group consists of text and usually a block diagram. The block diagram shows one channel only for simplicity.

The following is a list of the symbols that are used in the block diagrams, and their meaning.

Symbols

- Range check
- Amplifier
- Digital-to-Analog Converter
- Limit value check
- Filter, exponential
- Delay time
- Logical AND
- Logical OR
- Latch
- Logical NOR
- Setup Parameters and variables
- Error message

Channel and Pickup Selection Group

General

Configure VIBROCONTROL 1100 as a Single- or Dual-channel monitor. Use channel A or channel B in the Single-channel mode.

In the Dual-channel mode, VIBROCONTROL 1100 only accepts pickups of the same type and sensitivity.

Fig. 5-2: Parameter Group I, Channel Selection

<table>
<thead>
<tr>
<th>I01</th>
<th>Channel A</th>
</tr>
</thead>
<tbody>
<tr>
<td>Choices :</td>
<td>Y, N</td>
</tr>
<tr>
<td>Function :</td>
<td>Enable or disable Channel A.</td>
</tr>
<tr>
<td>Y = Yes</td>
<td>Channel A is active</td>
</tr>
<tr>
<td>N = No</td>
<td>Channel A is not active</td>
</tr>
</tbody>
</table>

I01 = Y : For measured value acquisition, connect a pickup to channel A.
I01 = N : Disables all measuring and monitoring functions for channel A.
I02  Channel B

Choices : Y, N
Function : Enable or disable Channel B.
   Y = Yes Channel B is active
   N = No Channel B is not active

I02 = Y : For measured value acquisition, connect a pickup to channel B.
I02 = N : Disables all measuring and monitoring functions for channel B.

I03  Transducers

Choices : a, v
Function : Select transducer type.
   I03 = a Use accelerometers.
   I03 = v Use vibration velocity transducers.

Use the same pickup type with the same sensitivity for channel A and B.

I04  Unit

Choices : mV/g, mV/m/s², mV/ips, mV/mm/s
Function : Define unit of pickup sensitivity.

I04 defines the unit of pickup sensitivity for both channels. If the unit does not match the pickup type, VIBROCONTROL 1100 generates error-message: -58.

Select

mV/g or mV/m/s² for accelerometers
mV/mm/s or mV/ips for vibration velocity transducers.
## I05 Sensitivity

<table>
<thead>
<tr>
<th>Range</th>
<th>Resolution</th>
</tr>
</thead>
<tbody>
<tr>

<td>3750</td>
</tr>
</tbody>
</table>

## I06 Frequency response linearization

Choices: Y, N

Function:
- Y = Yes Frequency response linearization is active
- N = No Frequency response linearization is not active

At a switch-on of the frequency response linearization, the Schenck vibration velocity pickup supplies an exact measurement even in low frequency ranges, e.g. measurements below the natural frequency of the pickup ($f_0 < 8 \text{ Hz}$ or $f_0 < 15 \text{ Hz}$ according to the pickup type).

The standard equipment of the VIBROCONTROL 1100 system comprises a frequency response linearization for transducer natural frequencies of $f_0 = 8 \text{ Hz}$. The special design for $f_0 = 15 \text{ Hz}$ is identified by the adhesive label "moving coil linearization 15 Hz" which is located on the right side of the printed circuit cover underneath the grounding bar, after opening the lid.
This page has been reserved for your notes.
Signal Detection Type Group J

General

Group J defines how the incoming vibration signal is processed and displayed.

The signal processing block diagram shows the function of the setup parameter and uses the following terms:

- **Vibration Signal**: Output of the vibration transducer.
- **Measured Parameter**: Vibration displacement, Vibration velocity, Vibration acceleration.
- **Unit**: Unit of the measured parameter.
- **Signal detection type**: rms, zero-to-peak calculated (pc), peak-to-peak calculated (ppc)

**Fig. 5 - 3**: Parameter Group J, Signal Detection Type

Measuring ranges

The measuring range depends on the selected pickup type, measured parameter, and signal detection type. The range is continuously adjustable within the minimum and maximum values shown in the table.
### Measuring range

</tbody>
</table>

**Fig. 5 - 4:** Parameter Group J, Signal Detection Type
J 01  Channel A :  Vibration

Choices : Y, N
Function : Enable or disable signal processing for channel A
Y = Yes  Channel A processes the vibration signal
N = No  Channel A does not processes the vibration signal

J 02  Channel B :  Vibration

Choices : Y, N
Function : Enable or disable signal processing for channel B
Y = Yes  Channel B processes the vibration signal
N = No  Channel B does not processes the vibration signal

J 03  Channel A :  Measured Parameter:

Choices : a, v, s
Function : Define the measured vibration parameter for channel A
a = Vibration acceleration
v = Vibration velocity
s = Vibration displacement

J 04  Channel B :  Measured Parameter

Choices : a, v, s
Function : Define the measured vibration parameter for channel B
a = Vibration acceleration
v = Vibration velocity
s = Vibration displacement
**J 05 Channel A : Unit**

Choices : g, m/s², ips, mm/s, mils, µm  
Select English or metric units for the measured vibration parameter of channel A.

- Select g or m/s² for vibration acceleration
- Select ips or mm/s for vibration velocity
- Select mils or µm for vibration displacement

<table>
<thead>
<tr>
<th>Unit</th>
<th>Measured Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>g m/s²</td>
<td>J03 = a</td>
</tr>
<tr>
<td>mm/s</td>
<td>J03 = v</td>
</tr>
<tr>
<td>µm mils</td>
<td>J03 = s</td>
</tr>
</tbody>
</table>

If the unit does not match the selected measured parameter (J03), the consistency check generates error-message -61.

**J 06 Channel B : Unit**

Choices : g, m/s², ips, mm/s, mils, µm  
Select English or metric units for the measured vibration parameter of channel B.

- Select g or m/s² for vibration acceleration
- Select ips or mm/s for vibration velocity
- Select mils or µm for vibration displacement

<table>
<thead>
<tr>
<th>Unit</th>
<th>Measured Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>g m/s²</td>
<td>J04 = a</td>
</tr>
<tr>
<td>mm/s</td>
<td>J04 = v</td>
</tr>
<tr>
<td>µm mils</td>
<td>J04 = s</td>
</tr>
</tbody>
</table>

If the unit does not match the selected measured parameter (J04), the consistency check generates the error-message -61.
**J 07 Channel A : Signal Setection Type**

Choices: rms, pc, ppc  
- **rms** = Root-mean-square value  
- **pc** = Zero-to-peak calculated value  
- **ppc** = Peak-to-peak calculated value

**J 08 Channel B : Signal Setection Type**

Choices: rms, pc, ppc  
- **s** = Root-mean-square value  
- **pc** = Zero-to-peak calculated value  
- **ppc** = Peak-to-peak calculated value

**J 09 Channel A : Full scale (Vibration)**

Range: 0.200 ... 999  
Resolution:  
- 0.200 ... 0.999  
- 1.00 ... 9.99  
- 10.0 ... 99.9  
- 100 ... 999  
Function: Define full scale value for the measured vibration parameter of channel A. You can use different full scale values for channel A and B.

VIBROCONTROL 1100 uses the full scale values to automatically configure the analog circuits, display functions, monitoring functions, and the analog outputs.

If you enter full scale values outside the ranges defined in the table, the consistency check generates error message -62.

**J 10 Channel B : Full scale (Vibration)**

Range: 0 ... 999  
Resolution:  
- 0.200 ... 0.999  
- 1.00 ... 9.99  
- 10.0 ... 99.9  
- 100 ... 999  
Function: Define full scale value for the measured vibration parameter of channel B. You can use different full scale values for channel A and B.

For more information see parameter J09
List of Setup Parameters VC 1100

J 11  Channel A : Bearing condition (BCU)

Choices : Y, N
Function : Enable or disable processing of BCU values for channel A.
Y = Process BCU for channel A.
N = Do not process BCU for channel A.
Connect an accelerometer to channel A to measure BCU.

J 12  Channel B : Bearing condition (BCU)

Choices : Y, N
Function : Enable or disable processing of BCU values for channel B.
Y = Process BCU for channel B.
N = Do not process BCU for channel B.
Connect an accelerometer to channel B to measure BCU.

J 13  Channel A : BCU Full scale:

Range : 1 ... 140
Resolution : 1,00 ... 9,99
            10,0 ... 99,9
            100 ... 140
Function : Define full scale value for BCU on channel A.
VIBROCONTROL 1100 uses the full scale value to automatically configure the BCU Signal Conditioner, display functions, monitoring functions, and the analog outputs.
You can use different full scale values for channel A and B. If you enter a value outside the defined range, the consistency check generates error-message: -62.

J 14  Channel B : BCU Full scale

Range : 1 ... 140
Resolution : 1,00 ... 9,99
            10,0 ... 99,9
            100 ... 140
Function : Define full scale value for BCU on channel B.
VIBROCONTROL 1100 uses the full scale value to automatically configure the BCU Signal Conditioner, display functions, monitoring functions, and the analog outputs.
You can use different full scale values for channel A and B. If you enter values outside the defined range, the consistency check generates error-message: -62.
### J 15 Channel A: BCU Averaging

Filter Configuration Group  K

General

Filters eliminate frequency components of the vibration signal outside a specified frequency range. The lower and upper frequency corners define the frequency range or the bandwidth of the filter. VIBROCONTROL 1100 provides several filters which are selected based on application. For each channel an upper and lower frequency corner is selected allowing each channel to use a different filter.

International standard ISO 2373 defines a filter that guarantees comparable readings (see also standards DIN/ISO 3945 and DIN 45 666). VIBROCONTROL 1100 provides this type of filter. ISO 2372 designates the frequency corners for this filter. The ISO-Filter has an order of 3. The other filters you can select are 2nd order Butterworth-filters. The damping at the specified frequency corner is -1 dB.

Special Filters

If an application requires special filters, please contact your SCHENCK representative.

VIBROCONTROL 1100 can extend the signal conditioner using a piggy-back PC board with the customized filter.

The parameter list references the special filter with the choice "special". If "special" is set, the supplementary filter is switched to the selected channel.

A label on the internal housing would show the specification for the special filter.

<table>
<thead>
<tr>
<th>K 01</th>
<th>Channel A : Lower Frequency Corner:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Choises : 1 Hz, 3 Hz, 10 Hz ISO</td>

<tr>
<td>3 Hz = Lower frequency corner</td>
<td></td>
</tr>
<tr>
<td>10 Hz ISO = Lower frequency corner</td>
<td></td>
</tr>
<tr>
<td>* special = Lower frequency corner</td>
<td></td>
</tr>
</tbody>
</table>

* Possible only if a supplementary filter is installed as an option.
K 02 Channel B : Lower Frequency Corner

Choices : 1 Hz, 3 Hz, 10 Hz ISO
Function : Select lower frequency corner for channel B
1 Hz = Lower frequency corner
3 Hz = Lower frequency corner
10 Hz ISO = Lower frequency corner
* special = Lower frequency corner

K 03 Channel A : Upper Frequency Corner:

Choices : 1000 Hz ISO, 10 kHz
Function : Select upper frequency corner for channel A.
1000 Hz ISO = Upper frequency corner
10 kHz = Upper frequency corner
* special = Upper frequency corner

K 04 Channel B : Upper Frequency Corner

Choices : 1000 Hz ISO, 10 kHz
Function : Select upper frequency corner for channel B.
1000 Hz ISO = Upper frequency corner
10 kHz = Upper frequency corner
* special = Upper frequency corner

* Possible only if a supplementary filter is installed as an option.
Analog Outputs Group L

General

VIBROCONTROL 1100 provides two analog outputs. Select which measured parameter is sent to analog output 1 and 2.

The full scale values selected in setup parameters J09/J10 and J13/J14 determine the analog output calibration.

Fig. 5 - 5: Parameter Group L, Analog Outputs

You cannot select BCU values if a vibration velocity transducer is used. The consistency check will generate error message: -65.

<table>
<thead>

Limit Value Configuration Group M

General

This parameter group enables or disables the monitoring functions for both channels. Three limit values can be defined for each channel; two for vibration levels and one for bearing condition. Each limit value can be enabled or disabled and its value and alarm delay time set individually.

The manual uses notations lim_1 (limit 1), lim_2 (limit 2), and lim_b (BCU) for the limit values. The unit of the corresponding measured parameter defines the unit of the limit value.

VIBROCONTROL 1100 accepts limit values in the range of 10 % to 100 % of the corresponding full scale. The consistency check generates error-message -63 if the limit values are outside this range.

Alarm delay times are in seconds. If the measured value exceeds the limit value for a time longer than the alarm delay time, VIBROCONTROL 1100 generates an event. The event is stored in the Log Book and the assigned relay is tripped as defined in the setup.

Warning:

When an OK error occurs, all limit relays maintain their current status. After removing the OK error and acknowledging it by "Relay reset", they perform their normal function again.
M 01 Channel A : Monitoring

Choices : Y, N
Function : Enable or disable vibration monitoring for channel A (lim_1, lim_2).
Y   = Monitoring for channel A is active.
N   = Monitoring for channel A is not active.

M 02 Channel B : Monitoring

Choices : Y, N
Function : Enable or disable vibration monitoring for channel B (lim_1, lim_2).
Y   = Monitoring for channel B is active.
N   = Monitoring for channel B is not active.

M 03 Channel A : Monitor lim_1

Choices : Y, N
Function : Enable or disable monitoring of limit value lim_1 A.
Y   = Monitoring lim_1 A.
N   = Do not monitoring lim_1 A.

M 04 Channel B : Monitor lim_1

Choices : Y, N
Function : Enable or disable monitoring of limit value lim_1 B.
Y   = Monitoring lim_1 B.
N   = Do not monitoring lim_1 B.

 Relay Configuration Group  N

General

VIBROCONTROL 1100 provides three relays to indicate alarm level exceedances. The relays are designated as K1, K2 and K3. Relay operation can be defined as follows:

Fig. 5 - 7 : Parameter Group N, Relais Configuration

Programmable Relay Operation:

1. Which alarm level exceedance controls which relay?
2. Latching or non-latching operation?
3. Normally energized or normally de-energized operation?
4. Logical combinations.

Comments to item 1:

It is common to assign alarm levels lim_1 of channel A and B to relay K1 and alarm levels lim_2 of channel A and B to relay K2.
Comments to item 2:
In the latching mode, a relay remains latched until VIBROCONTROL 1100 receives a reset command. In the non-latching mode, VIBROCONTROL 1100 resets the relays automatically when the monitored signal drops below the limit value.

Comments to item 3:
The following table shows the contact positions for normally de-energized and normally energized relay operating modes.

<table>
<thead>
<tr>
<th>Mode</th>
<th>No alarm</th>
<th>Alarm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normally de-energized</td>
<td>Relay active</td>
<td>Relay not active</td>
</tr>
<tr>
<td>Normally energized</td>
<td>Relay not active</td>
<td>Relay active</td>
</tr>
</tbody>
</table>

Comments to item 4:
If several alarm limits control one relay, combine the alarms using a logical AND or a logical OR.

**N 01 Channel A : lim_1 controls relay ...**

Choices : --, K1, K2, K3  
Function : Assign event "lim_1A exceeded" to a relay  
-- = lim_1A does not control a relay

| Choices : Y, N | Function : Select latching or non-latching operation for relay K3. |   |
| Y = Relay K3 latches. | N = Relay K3 does not latch. |   |

| N 10 | Relais K1 : Normally Energized |   |
| Choices : Y, N | Function : Select normally energized or normally de-energized mode for relay K1 |   |
| Y = Relay K1 operates normally energized. | N = Relay K1 operates normally de-energized. |   |
### N 11 Relais K2: Normally Energized

**Choices:** Y, N  
**Function:** Select normally energized or normally de-energized mode for relay K2.  
- **Y** = Relay K2 operates normally energized.  
- **N** = Relay K2 operates normally de-energized.

### N 12 Relais K3: Normally Energized

**Choices:** Y, N  
**Function:** Select normally energized or normally de-energized mode for relay K3.  
- **Y** = Relay K3 operates normally energized.  
- **N** = Relay K3 operates normally de-energized.

### N 13 Relais K1: Grenzwert-Verknüpfungen

**Choices:** OR, AND  
**Function:** Define how several alarm level exceedances control relay K1.  
- **OR** = Exceedance of at least one of the assigned alarm levels trips relay K1.  
- **AND** = Only exceedance of all assigned alarm levels trips relay K1.

### N 14 Relais K2: Logic

**Choices:** OR, AND  
**Function:** Define how several alarm level exceedances control relay K2.  
- **OR** = Exceedance of at least one of the assigned alarm levels trips relay K2.  
- **AND** = Only exceedance of all assigned alarm levels trips relay K2.

### N 15 Relais K3: Logic

**Choices:** OR, AND  
**Function:** Define how several alarm level exceedances control relay K3.  
- **OR** = Exceedance of at least one of the assigned alarm levels trips relay K3.  
- **AND** = Only exceedance of all assigned alarm levels trips relay K3.

OK-Monitoring Group

General

VIBROCONTROL 1100 has a cyclic self-monitoring routine. This routine tests the pickups and the cables between VIBROCONTROL 1100 and the pickups. The pickup signal is checked to verify that it remains within a predefined range. This method detects errors such as disconnected pickups, broken cables and shorts. If an OK error occurs, the OK relay is tripped and the event is stored in the Log Book.

Note:

When vibration velocity transducers with moving coil are used, lead breakage or short-circuit cannot usually be recognized. A constant current is thus superposed to the measuring signal. This current effects a direct voltage drop of approx. 1 V in the VC-1100. This voltage drop is measured as OK voltage.

The OK relay is configured to the normally energized mode. In this mode a power failure at the VIBROCONTROL 1100 will trip the OK relay to the alarm position.

In special cases, for example if line drivers or isolation amplifiers are used, it might be necessary to disable the OK monitoring function for the pickups. Therefore, VIBROCONTROL 1100 provides for disabling this function. This has no effect on other self-monitoring functions.

</tr>
</tbody>
</table>
O 03 Channel A : OK-Lower Limit

Choose : -23 V ... + 23 V
Function : The OK-limits are only settable for acceleration pickups.

O 04 Channel B : OK-Lower Limit

Choose : -23 V ... + 23 V
Function : The OK-limits are only settable for acceleration pickups.

O 05 Channel A : OK-Upper Limit

Choose : -23 V ... + 23 V
Function : The OK-limits are only settable for acceleration pickups.

O 06 Channel B : OK-Upper Limit

Choose : -23 V ... + 23 V
Function : The OK-limits are only settable for acceleration pickups.

Note for the definition of the OK-limits

If the input value of the OK-upper value is smaller than the input value for the OK-lower value, an OK error message is displayed.

The typical setting values for the OK-upper limit and the OK-lower limit are dependent on the transducer type. For SCHENCK transducers the following settings are recommended:

Velocity transducer (series VS - ...)
OK-upper limit : 2.5
OK-lower limit : 0.5

Acceleration sensor (series AS - ...)
OK-upper limit : -1
OK-lower limit : -20

Service Functions Gruppe  S

General

VIBROCONTROL 1100 provides direct access to the relays and analog outputs. Use these functions to test the connected peripherals including wiring.
These functions also help programmers of process control systems to verify the interface with VIBROCONTROL 1100. Additionally, VIBROCONTROL 1100 itself can be tested using the self-test and self-calibration functions.

Warning
The service functions suspend all measuring and monitoring functions.
Changing relay outputs could cause machine shutdown!

Relay Test

Switch each relay to the "active" and "inactive" position. Test the reaction of the system in both positions. Repeat the procedure for all relays including the OK-relay.

Analog Output Test

Set each analog output to a predefined output voltage or current. Check to see if the same levels are displayed, for example on the analog meter in the control room.

Self-test

The self-test takes about 15 seconds. During this test the most important modules of the microprocessor system are checked, including stored data. "Test" is displayed during the test along with a countdown from 10 to 0. The self-test is not interruptible. Normally, "TEST ok" is displayed at the end of the self-test. Press any key to continue.
If the self-test detects an error, the error message is displayed for x seconds and automatically restarts the system. The error message is stored in the Log Book.
Self-calibration

The self-calibration program takes about 15 minutes. During this time, the signal conditioners, multiplexers, and analog-to-digital converters, etc. are checked using an internally generated test signal.

This program does not have access to the input and output modules like relays, pre-amplifiers, and amplifiers for the analog outputs. Use the relay and analog output tests to check these functions.

"Calibration" is displayed during the self-calibration along with a number indicating the current test. This program is not interruptible. Remember that during self-calibration all measuring and monitoring functions are suspended.

The status of the relays and analog outputs does not change during the self-calibration.

6 Installation and Commissioning

Installation

VIBROCONTROL 1100
Mount rear side down
Vibration transducers: Consult transducer manual
Wiring: Consult chapter 3 of this manual
Grounding: Consult grounding recommendations

See chapters 2 and 3 of this manual for technical data and details on serial interfacing. Seal unused cable ports using ... AC-xxx.

Commissioning

CAUTION!
The safety instructions are attached as a separate brochure in different languages.

Check wiring
Check supply voltage

Power Monitor
Enter setup parameters required for this installation

Connect transducers
Once the transducers are connected and power is applied, the OK error must clear showing everything is configured correctly.

Connect peripheral devices to relays and analog outputs.
Connect serial interfaces as required
Checks

Use the VIBROCONTROL 1100 service functions to verify all connected peripheral functions. Service functions are described in chapter 5, under setup parameters group S.

Relays: Service parameters S01...S04
Analog outputs: Service parameters S05...S08

These functions provide a means to switch each relay separately and to set the analog outputs to predefined values.

Complete the installation by running self-test (S09) and auto-calibration (S10).

Recommendation

Run auto-calibration under operating conditions with the machinery running.
The auto-calibration function does not change setup parameters.
